

Architectural Steel

Quite often architectural steel is mixed with other materials to create a more aesthetically pleasing result, such as stair balustrading with glass infill panels or stainless steel wire that can cause problems with electrolytic corrosion. All of these little annoyances are well thought out here and standard details have been created to overcome the problems, but the point is we are up to speed on all aspects of drawing architectural steel to produce the client a quality and fast result. As the structural steel we can survey the site if required and the design, approval process, construction issue and fabrication detailing, holding down drawing, materials and bolt list is the same.

Any type of architectural steel is no problem here;

- Staircases
- Railings
- Canopies
- Balconies
- Hand rails
- Balustrading
- Gates
- Cat ladders
- Access platforms
- Ramps

...you name it and we can do it!
